

Pushing Changes into the Remote Repository (Lab)

 coursera.org/learn/git-distributed-development/supplement/jSk3i/pushing-changes-into-the-remote-repository-lab

Make some changes to your local repository, which we will then push to the remote location. You might just add a file, or change one of them, etc.

First, try using the ssh protocol. Do you have any problems?

Now try with the git:// protocol. For this to work, you will have to make sure to configure the daemon either with **--enable=receive-pack** for a global change for all repositories on your system (which is not smart) or by configuring the **config** file or your repository as noted previously.

Can you push an update through the https:// protocol?
